Know when your game hits your price

A shared watchlist for Steam games,
with target-price alerts.

REAL PRICES / PRIVATE WATCHLIST / WEB + ANDROID

Status · 09 Nov 2026

Local integration verified; hosted demo pending.

Five people, one shared product

Alex	Lead, integration & Flutter · @aluciencozy
Martin	React, TypeScript & Tailwind · @Martaino
Ibrahim	MongoDB, infrastructure & tests · @IbrahimShaqqou
James	Express authentication & API · @MageOfLight
Nick	CheapShark matching & email adapters · @NickTheBrick04

One specific offer, not any low price

01 IDENTIFY

Parse a supported Steam app URL locally.

02 COMPARE

Use the exact Steam offer in USD, not the all-store low.

03 ALERT

Notify when the user’s target is met; avoid repeats.

No DLC, bundles, guessed editions, or physical retailers in the MVP.

Two clients, one source of truth

CLIENTS

React + TypeScript
+ Tailwind
Flutter / Android

→

ASYNC HTTP / AJAX

SHARED API

Express + Node.js
TypeScript

→

PERSISTENCE

MongoDB / Mongoose
owned data

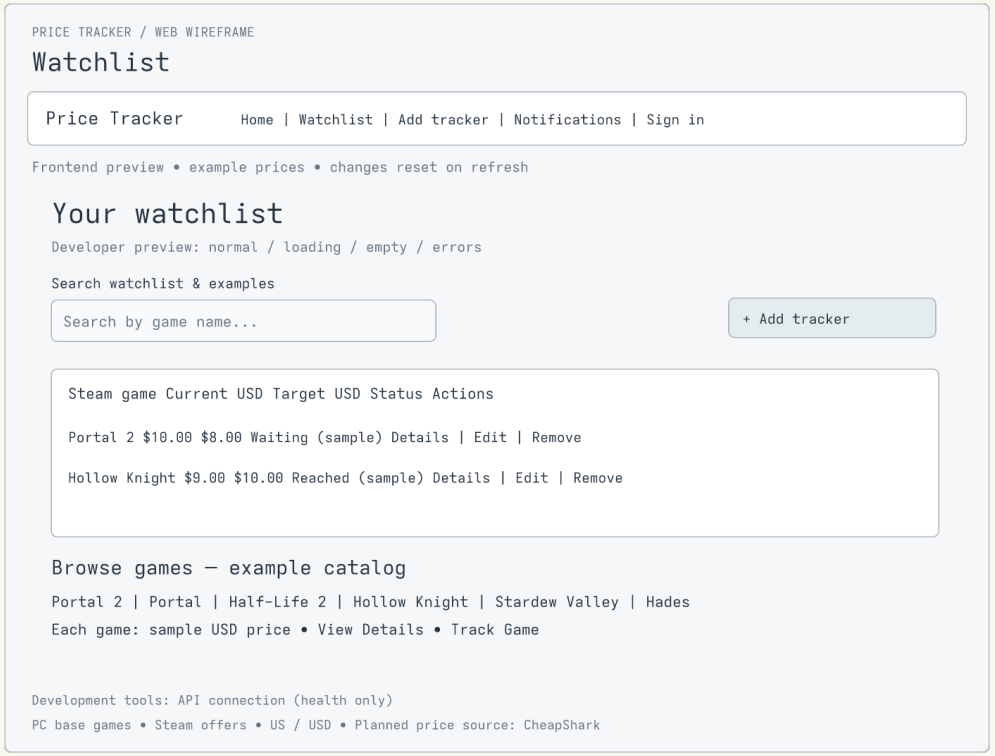

PRICE SOURCE

CheapShark · Steam

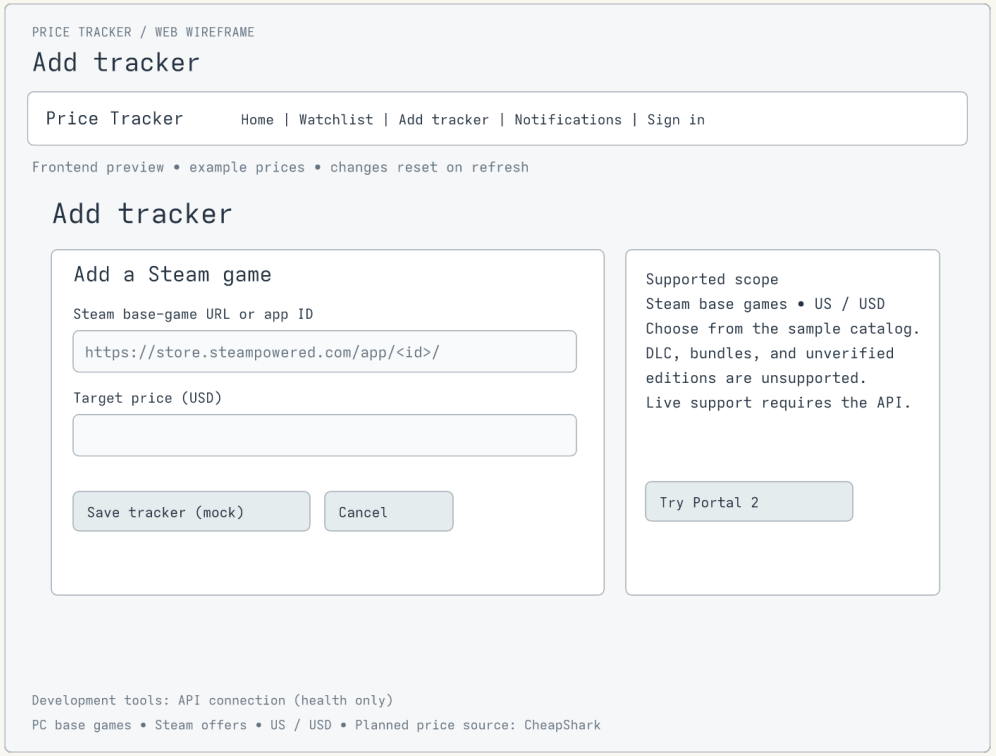

DELIVERY

Email + Android push

From early wireframes to the product

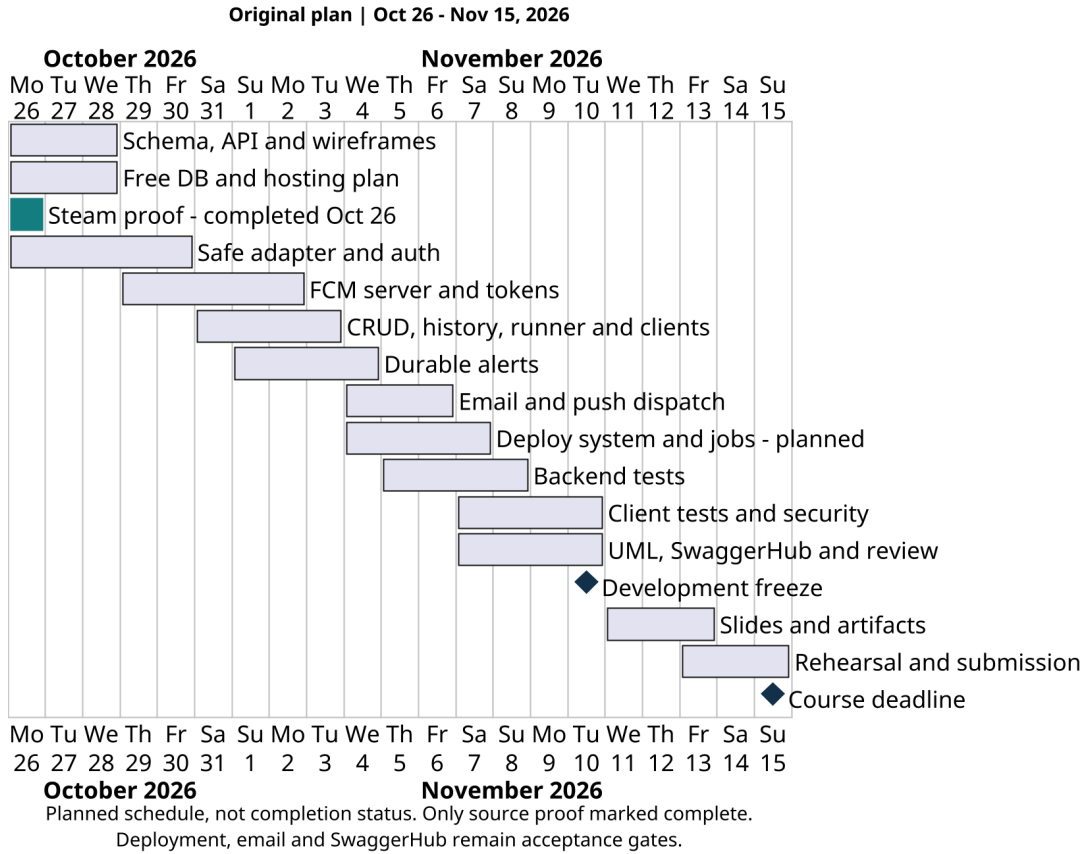

EARLY WIREFRAME / WATCHLIST

EARLY WIREFRAME / ADD

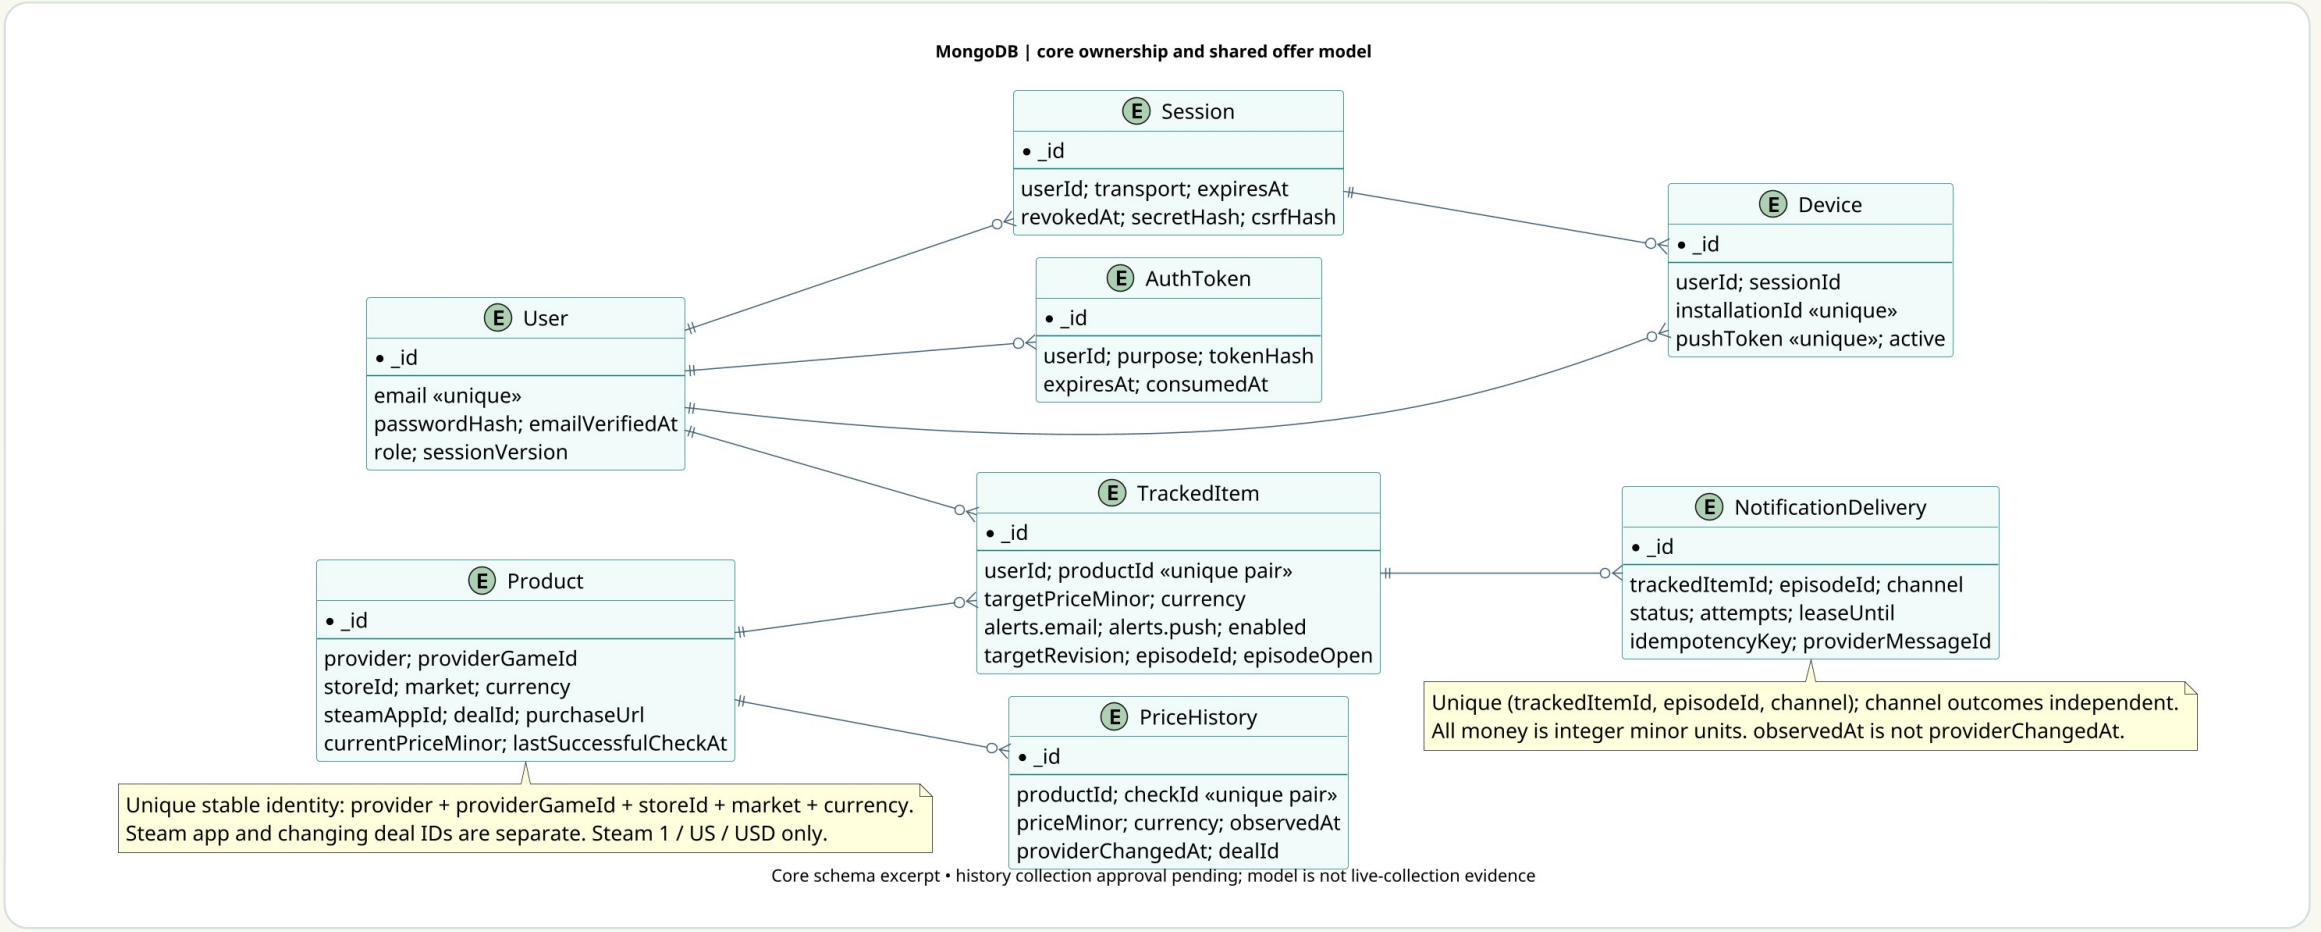

Sketch prices are illustrative, not live quotes.

The planned path to delivery

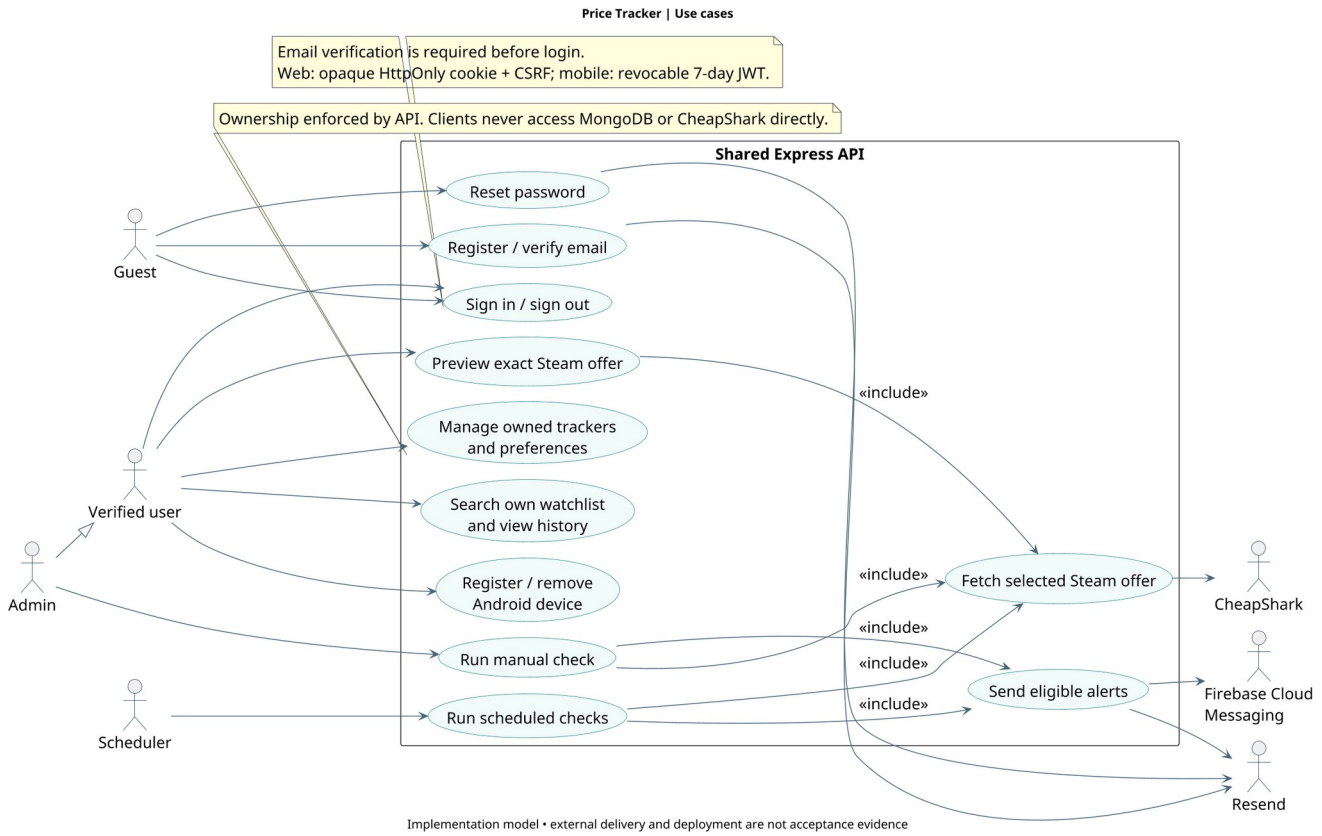

Planned schedule · Oct 26–Nov 15, 2026

Shared offers, private tracking

Shared products; user-owned targets and delivery state

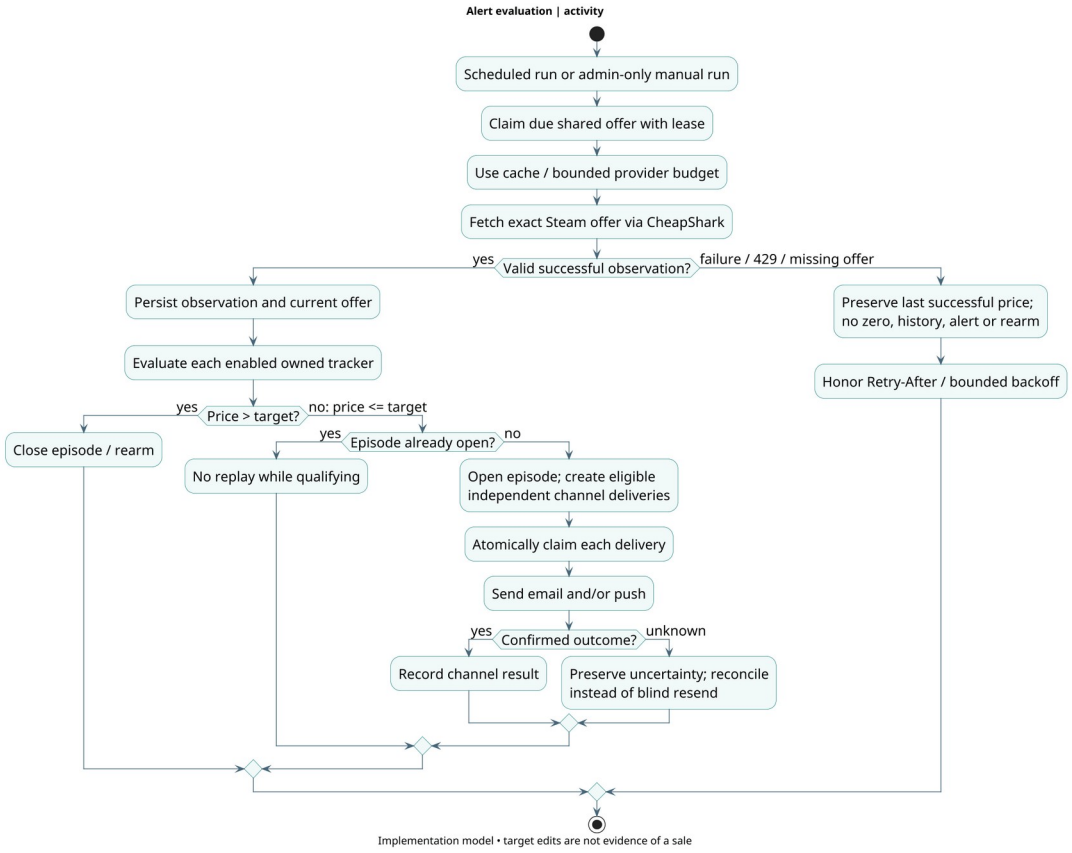

What users and administrators can do

The administrator’s manual check is separate from ordinary user actions

ACTIVITY DIAGRAM

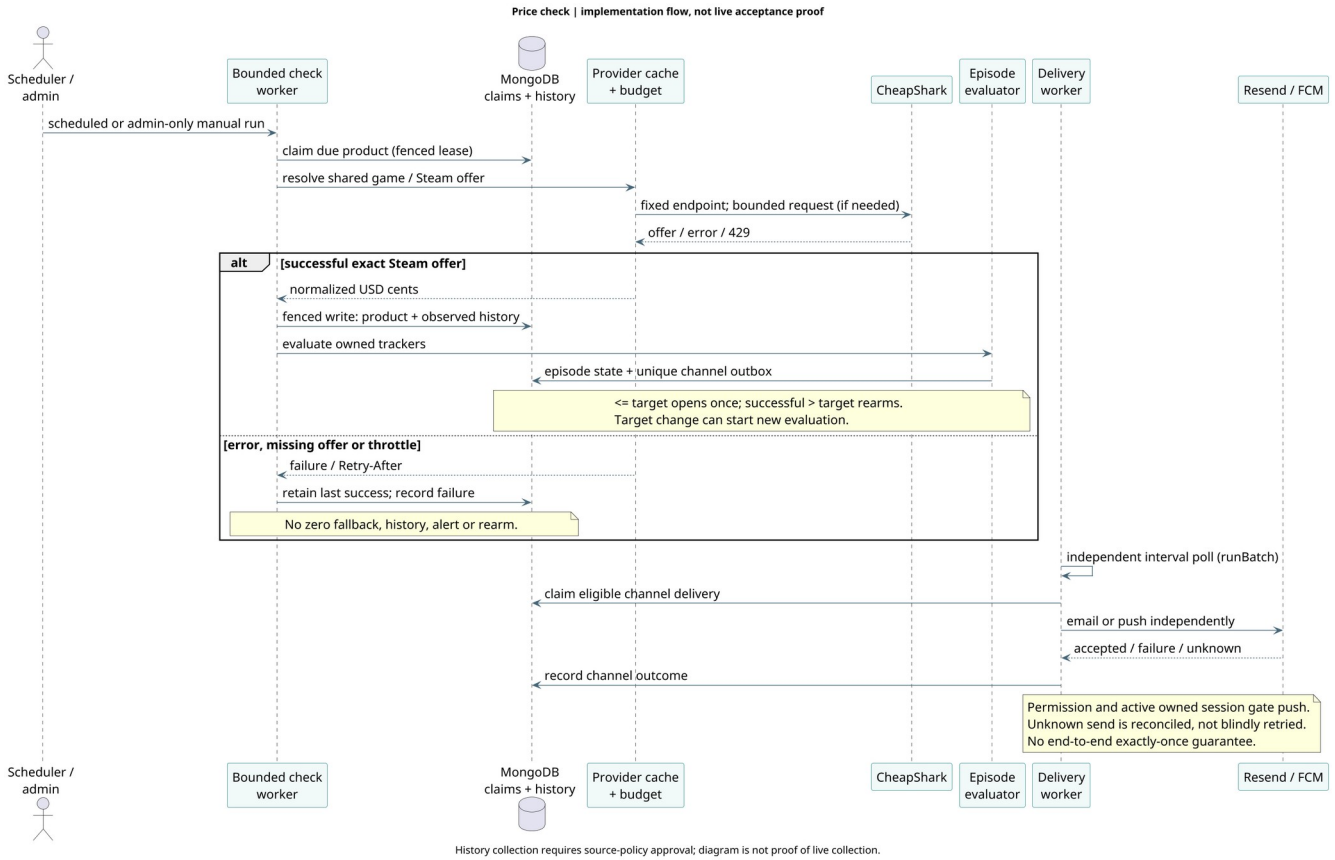

A successful check is not a repeat alert

A failed fetch is not a zero price

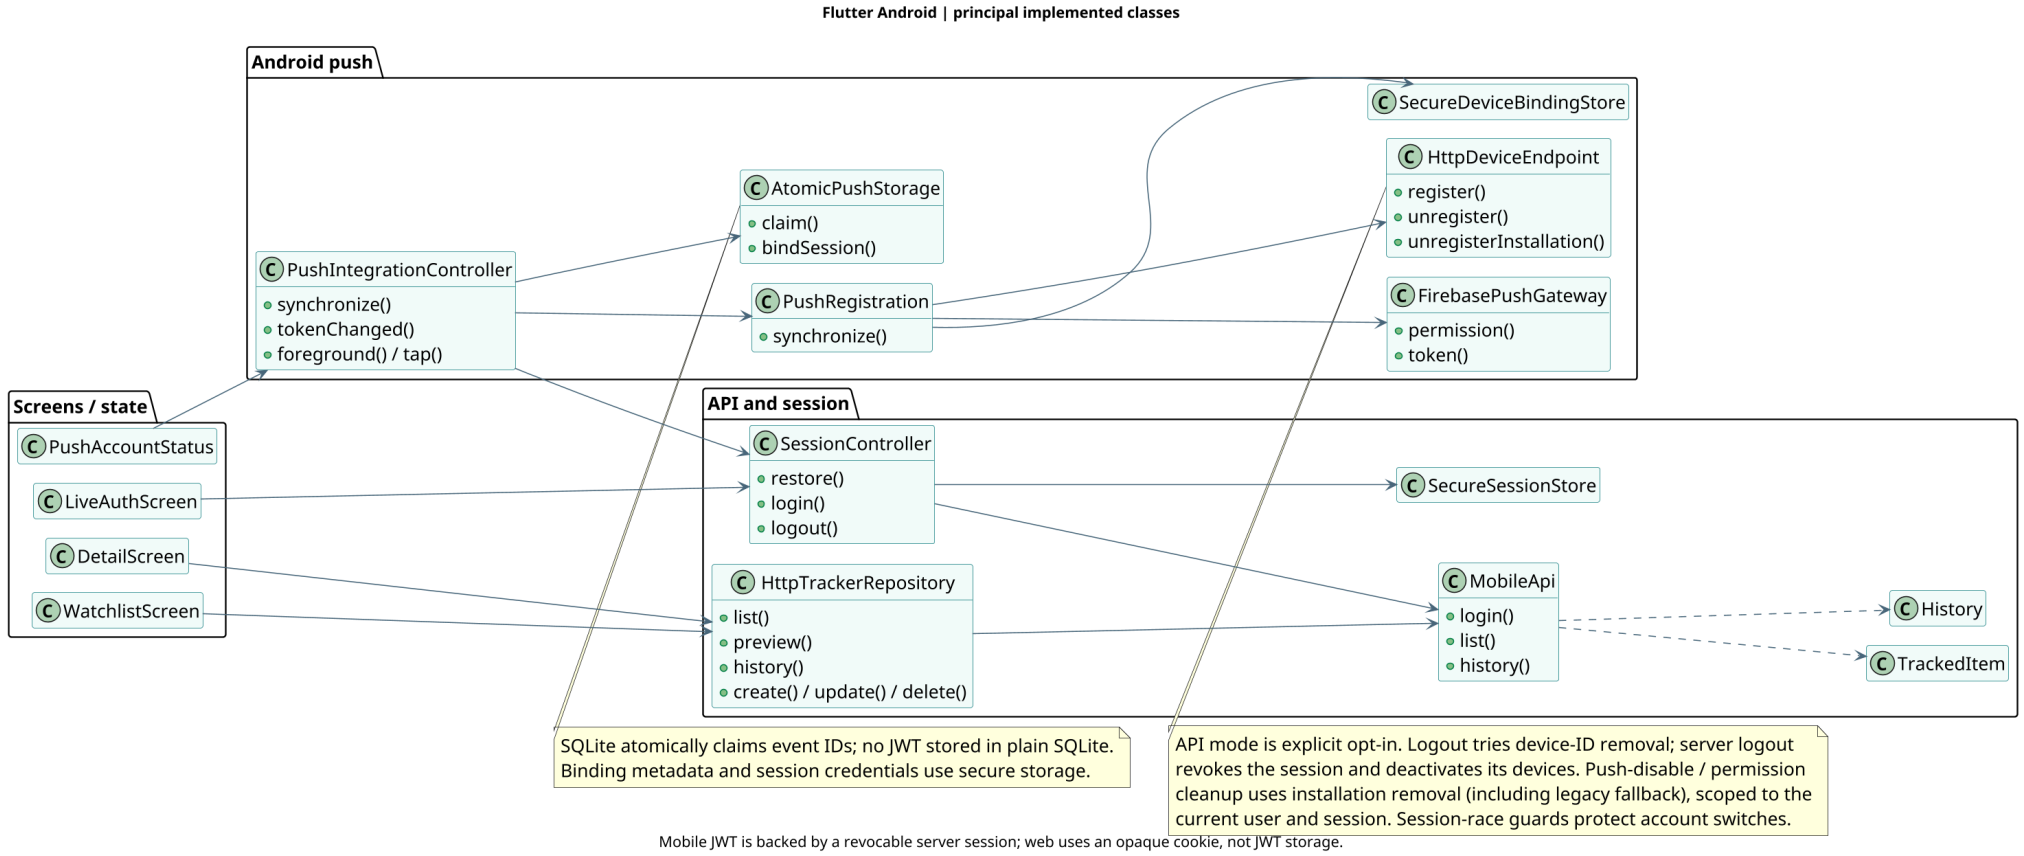

SEQUENCE DIAGRAM

From price check to delivery

Episode and per-channel records survive retries and restarts

Mobile separates screens from data

Flutter uses the same API and ownership rules as web

Security at the boundaries

IDENTITY

Verified email before login; hashed passwords and single-use reset tokens.

SESSIONS

Web: HttpOnly cookie + CSRF. Mobile: revocable JWT.

OWNERSHIP

Server scopes private resources to the signed-in user.

Tests are evidence, not deployment

700 / NODE

17 contract · 409 API
274 web

237 / FLUTTER

Format, analysis and tests passed

LOCAL QA

Cross-client ownership and Android lifecycle

Not a hosted end-to-end or real email acceptance claim.

Recorded validation: Nov 2026 · PR #61 open against Staging

Live API: authenticate, then search

01 POST /api/auth/mobile/login

Verified account → accessToken
Password entered live

02 GET /api/tracked-items

?q=por&limit=20
Server-side partial title match
Bearer token → owned results

CONFIGURE: published SwaggerHub URL + HTTPS API domain

Live web: the watchlist workflow

ACCOUNT

Register / verify / reset
Sign in with verified account

WATCHLIST

Search · add · edit target
Preferences · remove

CONFIGURE: verified live application domain

Live Android: the same account and data

SHARED STATE

Refresh on Android
See the same owned tracker

NOTIFICATIONS

Per-game email / push
Real delivery only when verified

CONFIGURE: Android build + approved live API

What we learned & what remains

WENT WELL

Shared API + fixtures enabled integration and privacy checks.

WAS DIFFICULT

Scope pivot, provider throttling and Android lifecycle races.

STILL OPEN

Hosted acceptance, SwaggerHub and real alert gates.

Questions / 50 seconds
